REGIONAL ALMOND VARIETY TRIALS

Planted in 1993

Warren C. Micke, Joseph H. Connell, Paul Verdegaal, Mario Viveros, James T. Yeager, Mary Ann Thorpe and Thomas M. Gradziel¹

Background

Regional Almond Variety Trials (RAVTs) were designed to evaluate newer varieties in a semi-commercial (20 to 40 trees per variety) manner and to compare them to standard varieties such as Nonpareil, Mission and currently accepted pollenizers.

Previous RAVTs were established between 1974 and 1981 in Kern, Colusa, Butte, San Joaquin and Fresno Counties. These trials were planted over several years and had trees of different ages and variety combinations. Thus, the data from these trials were not directly comparable and at this point data collection has ended.

1993 Trials

Three new RAVTs were established in 1993, and this leaflet presents data collected from these trials in 1998. These RAVTs are located in Butte County at the California State University at Chico farm (CSU-Chico), in San Joaquin County at the San Joaquin Delta College farm (Delta College) near Manteca and in Kern County at a Paramount Farming Company orchard (Kern) located south of Shafter and just off of 7th Standard road. At all locations signs are in place to identify each variety.

To be comparable these three new trials were all planted in the same year and with essentially the same variety composition. Thus, any differences in varietal performance among various regions should become evident. The only differences in variety composition among these trials were that Fritz was not included at the CSU-Chico trial (it was in the previous trial at this location) and Dottie Won was added to the Delta College plot. Some trees were planted/replanted after 1993. A few trees of several varieties were not available in 1993, especially for the Delta College trial. Vandalism and a tornado destroyed a few trees at CSU-Chico and normal replanting has occurred at all locations.

Varieties were planted on peach rootstock; Lovell for those at CSU-Chico and Nemaguard for trees in the Delta College and Kern plots. One exception, Kapareil, is being grown on both peach and peach-almond hybrid rootstocks at all locations, but data isn't always included in this publication for the trees on peach-almond hybrid.

The Kern plot is planted on a Milham sandy loam soil and is irrigated with micro-sprinklers. The trial at CSU-Chico is on a Vina loam soil and is irrigated with solid-set sprinklers. The Delta College trial

¹Warren C. Micke is Extension Pomologist, Emeritus, University of California, Davis. Joseph H. Connell, Paul Verdegaal, and Mario Viveros, are University of California Farm Advisors in Butte, San Joaquin, and Kern Counties, respectively. James T. Yeager and Mary Ann Thorpe are Staff Research Associates with the Pomology Department, University of California, Davis. Thomas M. Gradziel is Associate Professor of Pomology, University of California, Davis.

is on a Delhi loamy sand soil and is flood irrigated. Probably as a result of the coarse textured soil and flood irrigation, the trees in this latter trial are generally somewhat smaller than those in the other two RAVTs.

Varieties Included

Standard varieties are planted 1:1 with new varieties; Nonpareil for the early-mid blooming varieties and Mission for the late blooming varieties to ensure adequate pollination. In the Kern and Delta College trials, varieties are planted as a full row of 29 to 38 trees. With longer rows at CSU-Chico, each row has three different variety sections, with 21 to 25 trees per section. In addition to Nonpareil and Mission, a plot of each of seven "new standard" varieties (other varieties commonly planted today) has been included. These new standard varieties are Butte, Carmel, Fritz (not at CSU-Chico), Monterey, Padre, Price and Sonora.

The new varieties being tested in these trials are Aldrich, Chips, Donna, Dottie Won (Delta College only), Kahl, Kapareil, Jenette, Jiml, Johlyn, Livingston, Morley, Plateau, Rosetta, Ruby, Sano, Savana, Wood Colony and Yokut. While several of these varieties are not new to the almond industry, they had not been adequately tested in the uniform RAVT concept. In addition six numbered selections from a University of California at Davis almond breeding program were included in these trials. These are 1-87, 1-102W, 2-19 E, 2-43W, 13-1 and 25-75.

Data to be collected from these trials include bloom time, hullsplit/harvest time, yield, and nut quality. Trees in these trials are also being observed and evaluated for growth characteristics, pest and disease susceptibility and noninfectious bud failure symptoms.

1998 Data

This 1998 report includes information, mostly in table or graph form, on bloom time, hullsplit/harvest time, yields, shelling percentage (percent kernel) and kernel defects. Some information on disease susceptibility is also included. With marginal bloom time weather in 1998, yields for many but not all varieties were rather poor for trees in their **sixth growing season**. The Kern trial had the highest yields this year. In the early bearing years tree spacing can have a significant impact on production per acre, and trees per acre vary in these RAVTs with 86 trees per acre in the Kern trial, 64 trees per acre in the CSU-Chico trial and 75 trees per acre in the Delta College trial.

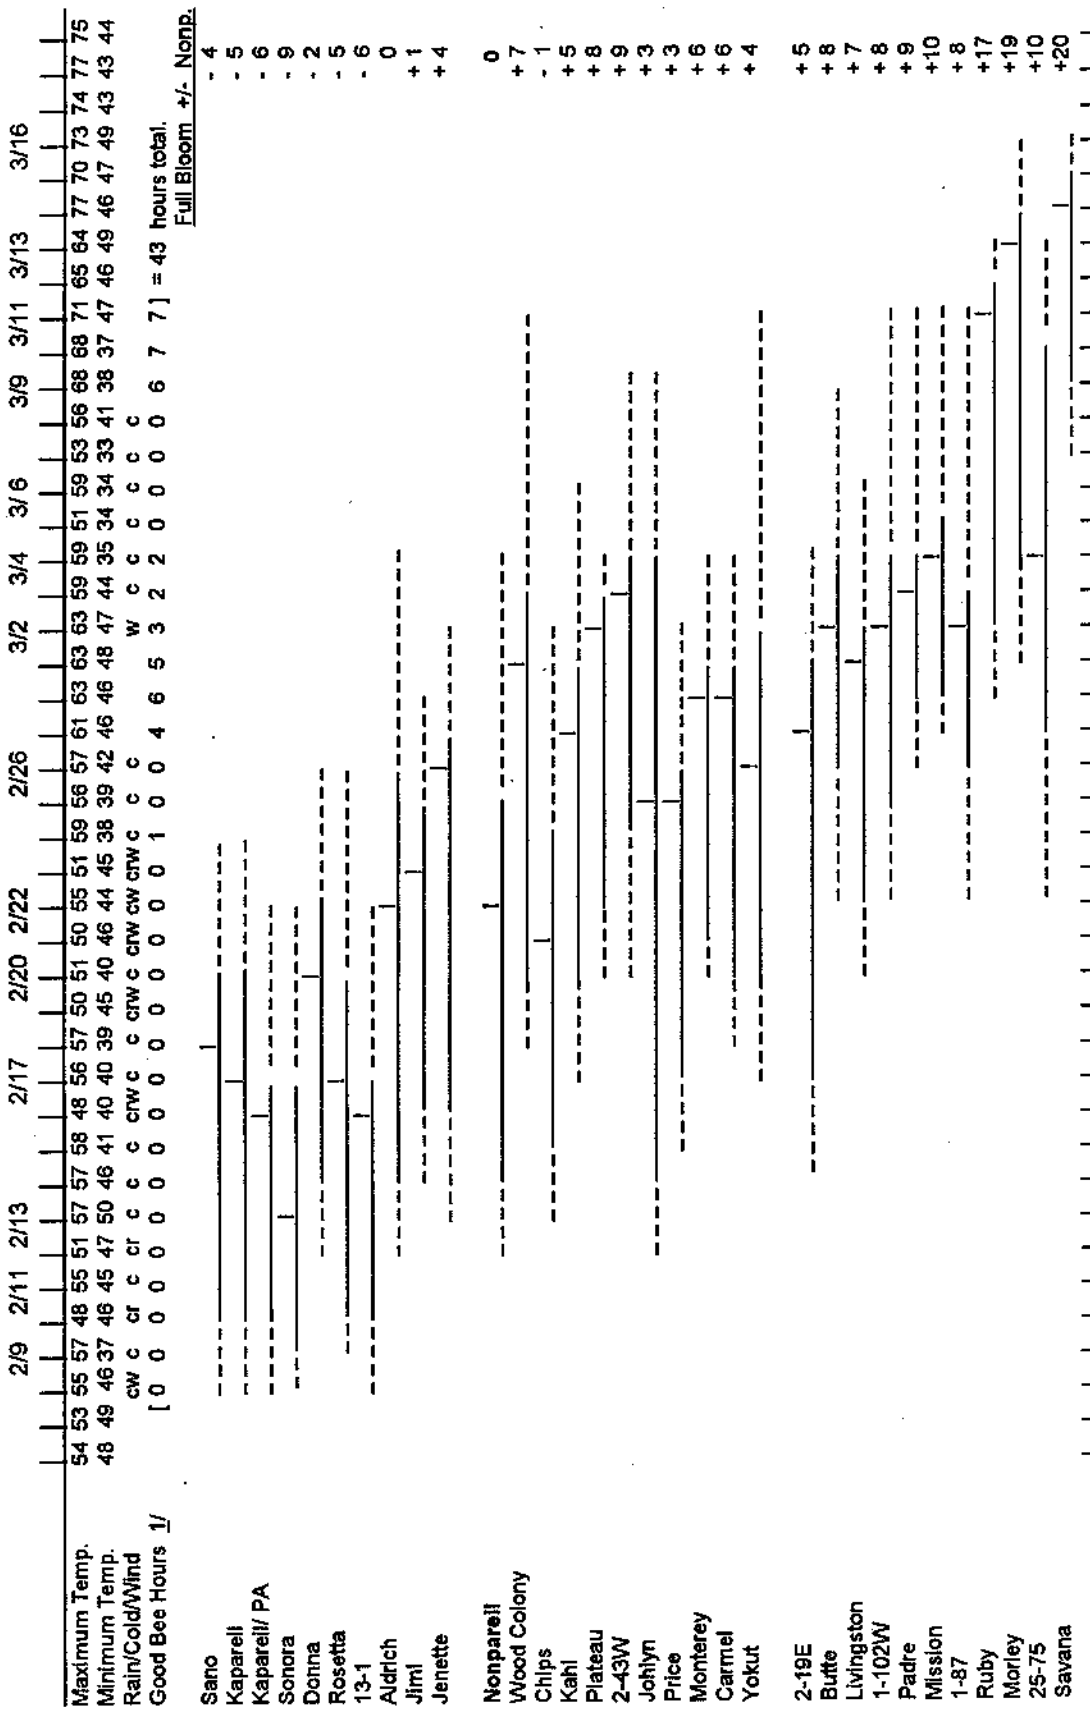

Again, this year a number of varieties produced a high percentage of double kernels in all of the RAVTs. In 1998 many varieties had a considerable number of shriveled kernels regardless of trial location. This shrivel may be caused by the cool, wet spring and early summer that resulted in kernels not filling properly. To date no symptoms of noninfectious bud failure have been seen in any variety in any of these trials.

Acknowledgements

The authors wish to thank the Almond Board of California for helping with tree purchase and for continued support of this project. The following nurseries supplied trees at reduced cost for these trials: Bright's Nursery, Burchell Nursery, Dave Wilson Nursery, Fowler Nursery, Sierra Gold Nurseries and Spoto Nursery. We particularly want to express our appreciation and thanks to the staffs of California State University at Chico, San Joaquin Delta College and Paramount Farming Company for excellent cooperation and for managing and maintaining these trials. The assistance of retired farm advisor Donald Rough, Cooperative Extension field assistants in Kern, Butte and San Joaquin Counties and field personnel of the University of California Pomology Department is gratefully acknowledged.

ALMOND REGIONAL VARIETY TRIAL - 1998 BLOOM

Planted in 1993 at the California State University Farm, Chico

Dashed line encompasses 1 to 100% bloom, solid line covers 10 to 90% bloom, full bloom date marked with a | = 80% bloom.
 1/ Good Bee Hours = total daylight hours between 1% bloom on Sonora and 100% bloom on Mission when temperatures are ≥ 59 F, wind ≤ 10 mph, and no rain.

This is a cooperative project between The Almond Board of California, California State University-Chico, and University of California Cooperative Extension. Prepared by: Joseph H. Connell, U.C. Farm Advisor, Butte County. 6/28/98.

Bloom Density
Almond Regional
Variety Trial - Chico

The density of bloom is rated annually for each variety on a subjective scale of 1 to 5 with a rating of 5 being the heaviest bloom. Consistency of bloom from one year to the next and tendencies toward alternate bloom/bearing may be indicated by these ratings.

Bloom Observations:

Good Blooming Varieties: Kahl, Yokut, Kapareil, Price, Aldrich, Carmel, Monterey, Sano, Wood Colony, Mission, and Butte.

Average Blooming Varieties: Nonpareil, Sonora, Padre, Fritz, Donna, Chips, Johlyn, and Ruby.

Poor Blooming Varieties: Rosetta, Jiml, Jenette, Livingston, and 1-102W.

Chilling Hours: 759

ALMOND REGIONAL VARIETY TRIAL - 1998 HARVEST MATURITY

Planted in 1993 at the California State University Farm, Chico

Dashed line encompasses 1 to 100% hullsplit. B -- denotes blanks beginning to split. S -- indicates that the variety was shaken to the ground at the time of the observation. Five harvests were conducted this year to complete harvest in the entire block. This is a cooperative project between the Almond Board of California, California State University-Chico, and University of California Cooperative Extension. Prepared by: Joseph H. Connell, U.C. Farm Advisor, Butte County. 11/5/98.

LATE-SEASON		
	Hullsplit Period	
	Beginning*	End**
Mission	8/25	9/27
Monterey	8/25	9/27
Fritz	8/28	9/30

*Beginning means one to five percent of hullsplit.

**End means 100% hullsplit.

NOTES: The length of the hullsplit period depended on crop load. Varieties with a big crop took longer to complete hullsplit than varieties with a light crop.

The hullsplit was also affected by Alternaria Leaf Spot disease.

¹Based on a spacing that gives 86 trees per acre.

KERNEL DEFECTS OBSERVED IN 1998

Significant defects noted in the 1998 harvest nut samples of the three RAVTs are outlined below. The trees were only in their sixth growing season. Defects listed may only become important if they continue to show in the same varieties over the next several years as the trees mature.

Defect	Trial		
	CSU-Chico	Delta College	Kern
Varieties with more than 20% double kernels:	Kahl Donna Plateau Mission Monterey Ruby Jiml	Plateau Kahl Price Monterey Sano	Plateau Donna Aldrich Mission Kahl Sano Fritz Monterey 2-43W
10-20% double kernels:	Price Sano Carmel 1-87 Jenette Yokut 2-43W	Fritz Aldrich Donna Wood Colony 2-43W Livingston Dottie Won Mission Jiml Padre	Livingston Ruby Carmel Padre
Varieties with 10% or more twin kernels (two kernels within the same pellicle):		Sonora Price Jiml Nonpareil Johlyn	2-19E
Varieties with 10% or more blank kernels:	Kahl Donna Yokut Morley Monterey	Kahl Price Jiml Johlyn	Sano Donna Kahl Livingston 2-43W
Varieties with 10% or more kernels with gum:		Livingston Savana Fritz	Jenette Livingston
Varieties with more than 4% worm damage (including ant damage):	Kapareil (A) ¹ Sano (A) 13-1 (A) 1-102 (A)	Kapareil (N & A) 13-1 (N & A)	Kapareil (A) Livingston (A)

¹ This damage caused by N (navel orangeworm) or A (ants). Very little peach twig borer damage was found in these trials in 1998.

**Diseases noted following the wet 1998 Spring
Almond Regional Variety Trial, Chico**

This list indicates diseases that were obvious when each variety was evaluated in August 1998. These were natural infections occurring in spite of fungicide applications. Other diseases may have been present but these are the ones that stood out on each variety. Fungicide sprays applied to the orchard are shown below.

Rhizopus Hull Rot

Nonpareil
Kapareil
Johlyn

Anthracnose

1-102 W
Ruby
Monterey
Wood Colony
13-1
2-43 W
Yokut

Alternaria Leaf Spot

Aldrich	1-87
Jiml	Butte
Livingston	Donna
Monterey	13-1
Wood Colony	
Sonora	

Leaf Blight

Nonpareil
Rosetta
Aldrich
Jiml
Mission
Padre
Carmel
Wood Colony
Yokut

Scab

1-102 W	(on leaves with leaf drop)
Sonora	(on leaves with leaf drop)
Sano	(on hulls and leaves with leaf drop)
13-1	(on hulls and leaves with leaf drop)
2-43 W	(on hulls)
Yokut	(on hulls)
Johlyn	(on hulls)
Nonpareil	(on hulls)

Varieties with No Significant Disease Noted

Chips	Price	25-75
Kahl	Plateau	2-19 E
Savana	Morley	Jenette

Fungicide Sprays applied to the orchard:

2/4 Rovral - on Sonora & Kapareil
2/13 Rovral - full spray by aircraft
2/18 Rovral - every other row by ground on Nonpareil & California varieties
2/27 Rovral - every other row by ground on all varieties
3/10 Rovral - every other row by ground on late varieties
4/11 Ziram - full spray by aircraft
4/22 Captan - full spray by ground
5/7 Break - full spray by ground
5/18 Captan - full spray by ground
6/2 Captan - full spray by ground
7/22 Sulfur - full spray by ground

Rated 8/14/98 by Joseph H. Connell, UC Farm Advisor, Butte County.
